Subject: Dimmock Report

Good Morning Roy:

I've been reading the latest on EPA's findings regarding contamination of wells in Dimmock. Although EPA says the levels of contamination are safe, please provide responses to these questions:

1. Were the levels of arsenic, sodium, methane , chromium and bacteria higher in the wells tested than wells in similar geological formations in that area?
2. Were any of the above contaminants attributable to hydrofracking?
3. Was the methane thermogenic or biogenic, or both?
4. Are there any studies showing how the interactions between arsenic, chromium and other contaminants might, together, affect human health.

Thank you so much.
